| Length               | 500 m                |

### Product description

In accordance with EN 50173-1 the designation S/FTP describes a cable with an individual pair shield of aluminium foil surrounded by a mesh as a total shield. These cables with LSZH sheath are mainly used in buildings to provide the horizontal cabling infrastructure. Other cables with cable sheaths such as PE or PUR are installed for applications with higher ambient demands or special mechanical application conditions. Cables with flexible wires are used as raw material for assemblies or in installations with a low range. S/FTP cables have very slight runtime differences between the pairs and are ideally suitable for transferring very high data rates.
